One fixed network, two trials
Match current content
Exchange memory
Continue computation
m = memory state
c = control state
Donor
$p_D \rightarrow H_D \rightarrow q$
Receiver
$p_R \rightarrow H_R \rightarrow q$
Same current permutation
Receiver (before)
Donor
m_R
c_R
m_D
c_D
m_D
c_R
Receiver after exchange:
(m_D , c_R)
Subsequent receiver inputs
Continue same recurrent network
Original readout
Answer
